\* Weighted Capitation Rates are shown in Exhibit GG.

<sup>1</sup> Breast and Cervical Cancer Program participants share a capitation rate with the remainder of the Adult population, and comprise less than 1% of that total population. As such, a forecast for BCCP program eligibles was not performed.

<sup>2</sup> The Department, as submitted in ES-2, is paying rates at -2.50% of the actuarial rate midpoint effective September 1, 2009. For Q1 and Q2, only 4 of the 6 months will be effected, making the rate adjustment -1.67% for that time period. This Request is replacing the ES-2 submission; this Exhibit accounts for the provider rate reduction component of ES-2, and Exhibit II accounts for the recoupment from providers.

<sup>3</sup> The final adjustment factor is derived by adding 1 to each individual adjustment, multiplying the result, and subtracting 1 from the product.

<sup>4</sup> The rate set for Q3 and Q4 of FY 2009-10 will be the same rate in effect for Q1 and Q2 of FY 2010-11.

<sup>5</sup> The same trend factors selected for the estimated rates for Q3 and Q4 of FY 2009-10 are carried forward to estimate the rates from the next rate setting cycle.

<sup>1</sup> Breast and Cervical Cancer Program participants share a capitation rate with the remainder of the Adult population, and comprise less than 1% of that total population. As such, a forecast for BCCP program eligibles was not performed.

<sup>2</sup> The Average Growth Model averages the change in the weighted rate from fiscal year to fiscal year and assumes that average growth will apply in future periods.

<sup>3</sup> The Two Period Moving Average Model uses the average rate of the previous two fiscal years and assumes that to be the rate in the forecasted year.

<sup>4</sup> The Exponential Growth Model generates a predictive equation based on time period and assuming that the rate of growth is directly proportional to the value of the rate (e.g. as the rate increases the rate of growth also increases).

<sup>5</sup> The Linear Growth Model generates a predictive equation by regressing the rate on the time period.

<sup>6</sup> The FY 2009-10 selected models are in bold, above; for Adults 65 and Older, Adult, and Children category eligibles, the change in rate from FY 2007-08 to FY 2008-09 was applied to the rate change from FY 2009-10 Q1 and Q2 to the Q3 and Q4 rate; for Disabled eligibles, a linear trend was selected as that trend mirrors the rate of change seen for this eligibility category but for the Goebel settlement year; the growth rate of Foster Care category eligible rates has been trending downward as historical data has had diminishing influence on the rate (see budget narrative); the smallest magnitude of historical rate change in the Foster Care rate was selected and applied to the rate change from Q1 and Q2 to Q3 and Q4.
